### std:: queue

```
Defined in header <queue>
template<
    class T,
    class Container = std::deque<T>
> class queue;
```

The std::queue class is a container adapter that gives the programmer the functionality of a queue specifically, a FIFO (first-in, first-out) data structure.

The class template acts as a wrapper to the underlying container - only a specific set of functions is provided. The queue pushes the elements on the back of the underlying container and pops them from the front.

#### **Template parameters**

T - The type of the stored elements.

- **Container** The type of the underlying container to use to store the elements. The container must satisfy the requirements of SequenceContainer. Additionally, it must provide the following functions with the usual semantics:
  - back()
  - front()
  - push back()
  - pop front()

The standard containers std::deque and std::list satisfy these requirements.

#### **Member types**

Member type	Definition
container_type	Container
value_type	Container::value_type
size_type	Container::size_type
reference	Container::reference
const_reference	Container::const_reference

#### **Member functions**

(constructor)	constructs the queue (public member function)
(destructor)	destructs the queue (public member function)
operator=	assigns values to the container adaptor (public member function)

#### Element access

front	access the first element (public member function)
back	access the last element (public member function)

#### Capacity

empty	checks whether the underlying container is empty
-------	--

	(public member function)
size	returns the number of elements (public member function)

#### Modifiers

push	inserts element at the end (public member function)
emplace (C++11)	constructs element in-place at the end (public member function)
pop	removes the first element (public member function)
swap	swaps the contents (public member function)

### **Member objects**

Container <b>C</b>	the underlying container
	(protected member object)

### **Non-member functions**

<pre>operator== operator&lt; operator&lt;= operator&gt; operator&gt;=</pre>	lexicographically compares the values in the queue (function template)
<pre>std::swap(std::queue)</pre>	specializes the std::swap algorithm (function template)

### Helper classes

<pre>std::uses_allocator<std::queue></std::queue></pre>	(C++11)	<pre>specializes the std::uses_allocator type trait</pre>
		(function template)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue&oldid=64023"

### std::queue::QUeue

<pre>explicit queue( const Container&amp; cont = Container() );</pre>	(1)	(until C++11)
<pre>explicit queue( const Container&amp; cont );</pre>	(.,	(since C++11)
<pre>explicit queue( Container&amp;&amp; cont = Container() );</pre>	(2)	(since C++11)
<pre>queue( const queue&amp; other );</pre>	(3)	
queue( queue&& other );	(4)	(since C++11)
<pre>template&lt; class Alloc &gt; explicit queue( const Alloc&amp; alloc );</pre>	(5)	(since C++11)
<pre>template&lt; class Alloc &gt; queue( const Container&amp; cont, const Alloc&amp; alloc );</pre>	(6)	(since C++11)
<pre>template&lt; class Alloc &gt; queue( Container&amp;&amp; cont, const Alloc&amp; alloc );</pre>	(7)	(since C++11)
<pre>template&lt; class Alloc &gt; queue( const queue&amp; other, const Alloc&amp; alloc );</pre>	(8)	(since C++11)
<pre>template&lt; class Alloc &gt; queue( queue&amp;&amp; other, const Alloc&amp; alloc );</pre>	(9)	(since C++11)

Constructs new underlying container of the container adaptor from a variety of data sources.

- 1) Copy-constructs the underlying container c with the contents of cont. This is also the default constructor (until C++11)
- 2) Move-constructs the underlying container c with std::move(cont). This is also the default constructor (since C++11)
- 3) Copy constructor. The adaptor is copy-constructed with the contents of other.c . (implicitly declared)
- 4) Move constructor. The adaptor is constructed with std::move(other.c) . (implicitly declared)
- 5-9) The following constructors are only defined if [std::uses\_allocator<container\_type, Alloc>::value == true], that is, if the underlying container is an allocator-aware container (true for all standard library containers).
  - 5) Constructs the underlying container using alloc as allocator. Effectively calls c(alloc).
  - 6) Constructs the underlying container with the contents of cont and using alloc as allocator. Effectively calls c(cont, alloc).
  - 7) Constructs the underlying container with the contents of cont using move semantics while utilising alloc as allocator. Effectively calls c(std::move(cont), alloc).
  - 8) Constructs the adaptor with the contents of other.c and using alloc as allocator. Effectively calls c(athor.c, alloc).
  - 9) Constructs the adaptor with the contents of other using move semantics while utilising alloc as allocator. Effectively calls [c(std::move(other.c), alloc)].

#### **Parameters**

- alloc allocator to use for all memory allocations of the underlying container
- other another container adaptor to be used as source to initialize the underlying container
- cont container to be used as source to initialize the underlying container
- first, last range of elements to initialize with

#### Type requirements

- Alloc must meet the requirements of Allocator.
- Container must meet the requirements of Container. The constructors (5-10) are only defined if Container meets the requirements of AllocatorAwareContainer
- InputIt must meet the requirements of InputIterator.

### Complexity

1, 3, 5, 6, 8: linear in cont or other

2, 4, 7, 9: constant

This section is incomplete

#### **Example**

#### Run this code

```
#include <queue>
#include <deque>
#include <iostream>

int main()
{
    std::queue<int> c1;
    c1.push(5);
    std::cout << c1.size() << '\n';

    std::queue<int> c2(c1);
    std::cout << c2.size() << '\n';

    std::deque<int> deq {3, 1, 4, 1, 5};
    std::queue<int> c3(deq);
    std::queue<int> c3(deq);
    std::cout << c3.size() << '\n';
}</pre>
```

#### Output:

```
1
1
5
```

#### See also

# std::queue::~queue

~queue();

Destructs the container adaptor. The destructors of the elements are called and the used storage is deallocated. Note, that if the elements are pointers, the pointed-to objects are not destroyed.

### Complexity

Linear in the size of the container adaptor.

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/%7Equeue&oldid=50643"

# std::queue::Operator=

```
queue operator=( const queue& other ); (1)
queue operator=( queue&& other ); (2) (since C++11)
```

Replaces the contents of the container adaptor with those of other.

- 1) Copy assignment operator. Replaces the contents with a copy of the contents of other. Effectively calls c = other.c; (implicitly declared)
- 2) Move assignment operator. Replaces the contents with those of other using move semantics. Effectively calls c = std::move(other.c); (implicitly declared)

#### **Parameters**

other - another container adaptor to be used as source

#### Return value

\*this

#### Complexity

Equivalent to that of operator of the underlying container.

#### See also

(constructor) constructs the queue (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/operator%3D&oldid=41753"

# std::queue::front

```
reference front();
const_reference front() const;
```

Returns reference to the first element in the queue. This element will be the first element to be removed on a call to pop(). Effectively calls c.front().

#### **Parameters**

(none)

#### Return value

Reference to the first element.

### Complexity

Constant

#### See also

back	access the last element (public member function)
pop	removes the first element (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/front&oldid=60968"

# std::queue::back

```
reference back();
const_reference back() const;
```

Returns reference to the last element in the queue. This is the most recently pushed element. Effectively calls  $c \cdot back()$ .

#### **Parameters**

(none)

#### Return value

reference to the last element

### Complexity

Constant

#### See also

front	access the first element (public member function)
push	inserts element at the end (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/back&oldid=69407"

# std::queue::empty

```
bool empty() const;
```

Checks if the underlying container has no elements, i.e. whether c.empty().

#### **Parameters**

(none)

#### Return value

true if the underlying container is empty, false otherwise

### Complexity

Constant

#### See also

size returns the number of elements (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/empty&oldid=50634"

# std::queue::SiZe

```
size_type size() const;
```

Returns the number of elements in the underlying container, that is, c.size().

#### **Parameters**

(none)

#### Return value

The number of elements in the container.

### Complexity

Constant.

#### See also

checks whether the underlying container is empty (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/size&oldid=50639"

# std::queue::push

```
void push( const T& value );
void push( T&& value ); (since C++11)
```

Pushes the given element value to the end of the queue.

```
    Effectively calls c.push_back(value)
    Effectively calls c.push_back(std::move(value))
```

#### **Parameters**

value - the value of the element to push

#### Return value

(none)

### Complexity

Equal to the complexity of Container::push\_back .

#### See also

emplace (C++11)	constructs element in-place at the end (public member function)
pop	removes the first element (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/push&oldid=50637"

# std::queue::emplace

```
template< class... Args >
void emplace( Args&&... args );
(since C++11)
```

Pushes new element to the end of the queue. The element is constructed in-place, i.e. no copy or move operations are performed. The constructor of the element is called with exactly the same arguments as supplied to the function.

Effectively calls c.emplace\_back(std::forward<Args>(args)...)

#### **Parameters**

args - arguments to forward to the constructor of the element

#### Return value

(none)

#### Complexity

Identical to the complexity of Container::emplace back.

#### See also

push	inserts element at the end (public member function)
рор	removes the first element (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/emplace&oldid=50633"

# std::queue::pop

```
void pop();
```

Removes an element from the front of the queue. Effectively calls [c.pop\_front()]

#### **Parameters**

(none)

#### Return value

(none)

### Complexity

Equal to the complexity of Container::pop\_front .

#### See also

emplace (C++11)	constructs element in-place at the end (public member function)
push	inserts element at the end (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/pop&oldid=50636"

### std::queue::SWap

```
void swap( queue& other ); (since C++11)
```

Exchanges the contents of the container adaptor with those of other. Effectively calls using std::swap; swap(c, other.c);

#### **Parameters**

other - container adaptor to exchange the contents with

#### Return value

(none)

### **Exceptions**

noexcept specification:

```
noexcept(noexcept(std::swap(c, other.c)))
```

#### Complexity

Same as underlying container (typically constant)

#### See also

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/swap&oldid=50640"

# operator==,!=,<,<=,>,>=(std::queue)

```
template< class T, class Container >
bool operator==( queue<T,Container>& lhs,
                                                (1)
                 queue<T,Container>& rhs );
template< class T, class Container >
bool operator!=( queue<T,Container>& lhs,
                                                (2)
                 queue<T,Container>& rhs );
template< class T, class Container >
bool operator<( queue<T,Container>& lhs,
                                                (3)
                queue<T,Container>& rhs );
template< class T, class Container >
bool operator<=( queue<T,Container>& lhs,
                                                (4)
                 queue<T,Container>& rhs );
template< class T, class Container >
bool operator>( queue<T,Container>& lhs,
                                                (5)
                queue<T,Container>& rhs );
template< class T, class Container >
bool operator>=( queue<T,Container>& lhs,
                                                (6)
                 queue<T,Container>& rhs );
```

Compares the contents of the underlying containers of two container adaptors. The comparison is done by applying the corresponding operator to the underlying containers.

#### **Parameters**

1hs, rhs - container adaptors whose contents to compareT must meet the requirements of EqualityComparable.

#### Return value

true if the corresponding comparison yields true, false otherwise.

#### Complexity

Linear in the size of the container

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/operator\_cmp&oldid=50635"

### std::SWap(std::queue)

Specializes the std::swap algorithm for std::queue. Swaps the contents of 1hs and rhs. Calls [1hs.swap(rhs)].

#### **Parameters**

lhs, rhs - containers whose contents to swap

#### Return value

(none)

### Complexity

Same as swapping the underlying container.

```
Exceptions

noexcept specification:

noexcept(noexcept(lhs.swap(rhs)))

(since C++17)
```

#### See also

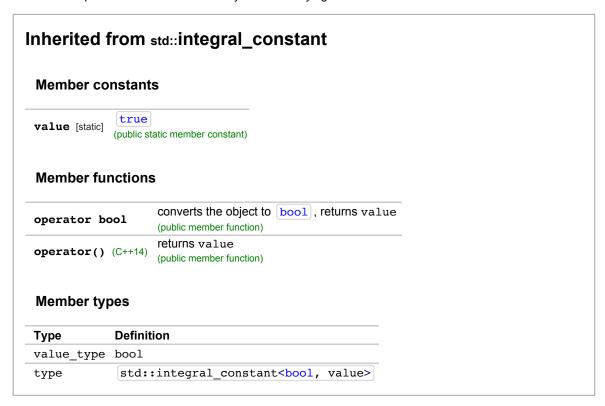

swap swaps the contents (public member function)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/swap2&oldid=50641"

# std::uses\_allocator<std::queue>

```
template< class T, class Container, class Alloc >
struct uses_allocator<queue<T,Container>,Alloc> :
    std::uses_allocator<Container, Alloc>::type { };
```

Provides a transparent specialization of the std::uses\_allocator type trait for [std::queue]: the container adaptor uses allocator if and only if the underlying container does.

#### See also

**uses\_allocator** (C++11) checks if the specified type supports uses-allocator construction (class template)

Retrieved from "http://en.cppreference.com/mwiki/index.php?title=cpp/container/queue/uses\_allocator&oldid=50642"
